

A large blue and white LNG-fueled vessel is shown sailing on the ocean. The vessel has a white upper hull and a blue lower hull. It is moving from left to right, leaving a white wake. The sky is clear and blue. The image is overlaid with a semi-transparent blue band at the bottom.

LNG Fuelled Vessels

LNG as fuel for ships - Drivers

Environmental: Emission Control Areas (ECA, SECA) impose either the use of “clean” fuels or treatment of exhaust gas (or both)

Economical: price of LNG is competitive and may be even more in the long term

Availability & politics: Gas market is somewhat detached from oil market

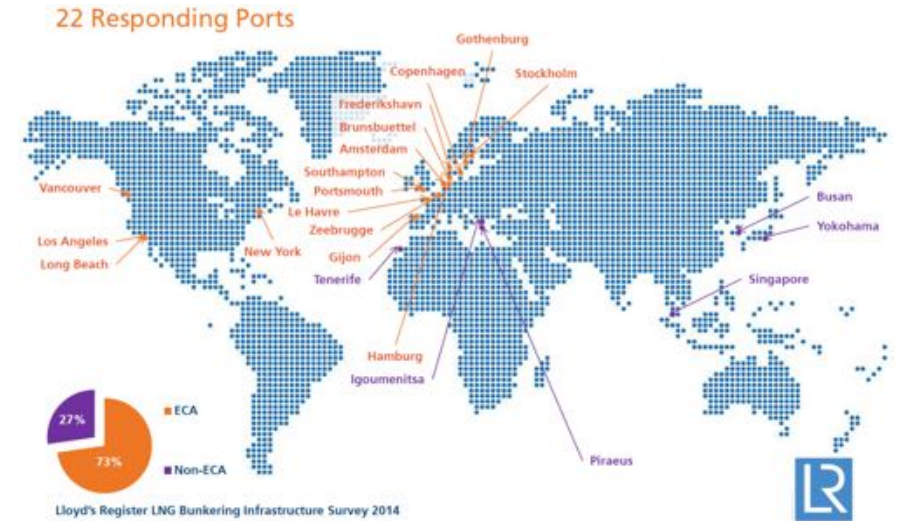

Is it going to happen?

According to LR Bunkering Infrastructure Survey 2014, carried out involving 22 major seaports in Europe, North America and Asia:

- 59% of them either have in place or have plan to provide LNG bunkering infrastructure for local shipping.
- 86% consider LNG as likely or very likely to be a viable bunker fuel for deep sea shipping
- 76% of them have a timeframe of 0 to 5 years for LNG bunkering operations to commence. For the others the time frame is no more than 10 years.

The answer therefore is yes, it is happening and there are good reasons to expect that it will eventually grow up quickly.

LNG Fuelled Ships: Why Ferries?

Routes mostly or wholly in SECA & NECA areas

No deep sea journeys

Limited LNG fuel consumption & frequent stops

LNG would meet both SO_x & NO_x requirements

Single bunkering facility/point can cover the whole route/s

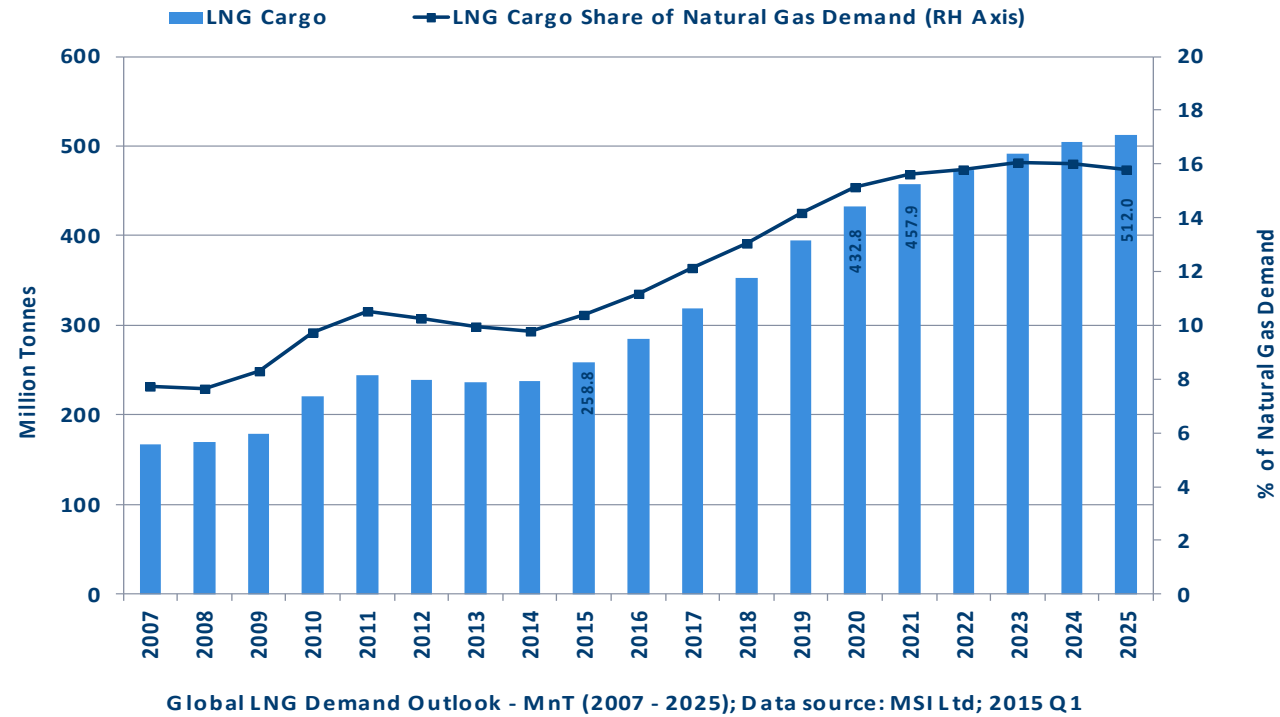

Flexibility in bunkering technology and LNG fuel supply alternatives

Global Marine Fuel Trends 2030

LNG will reach up to 11% of the Deep Sea fuel mix by 2030

LNG cargo as a % of Natural Gas – 15.8% by 2025

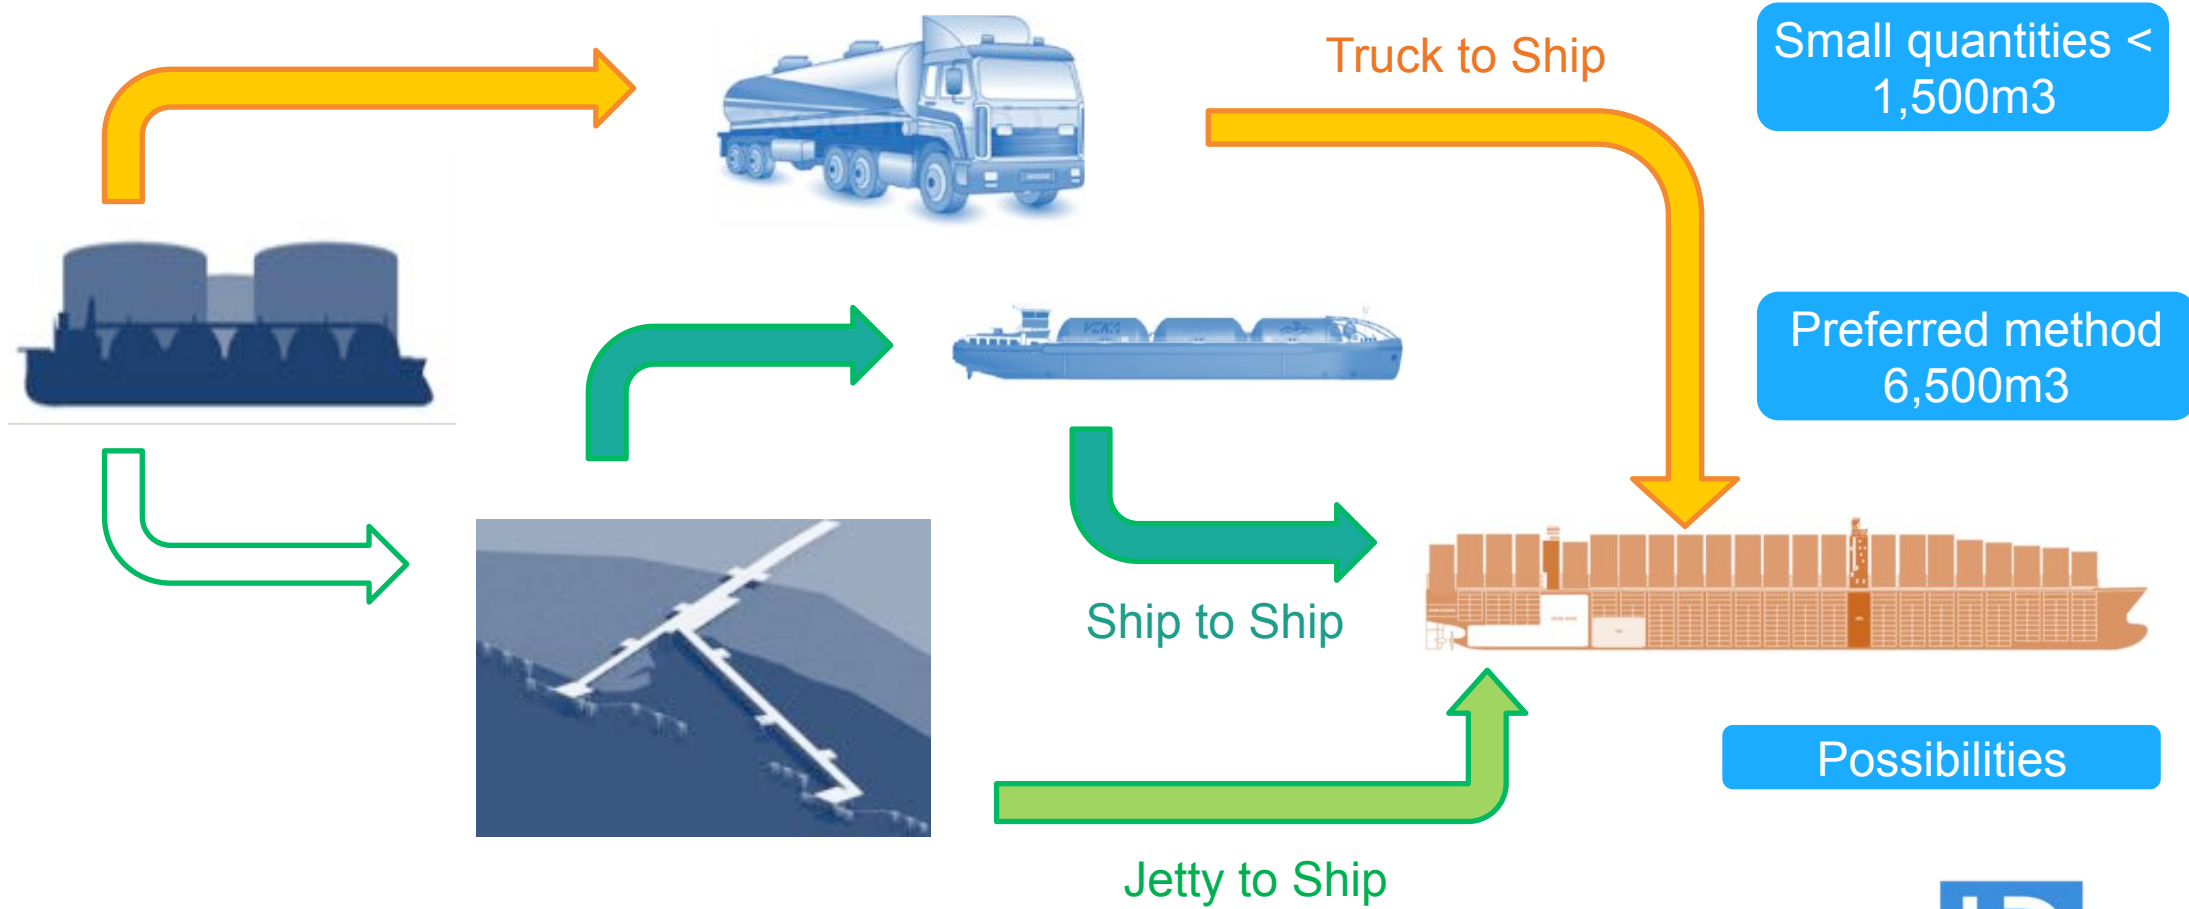

Global LNG Demand Outlook - Mnt (2007 - 2025); Data source: MSI Ltd; 2015 Q1

LNG Bunkering Solutions

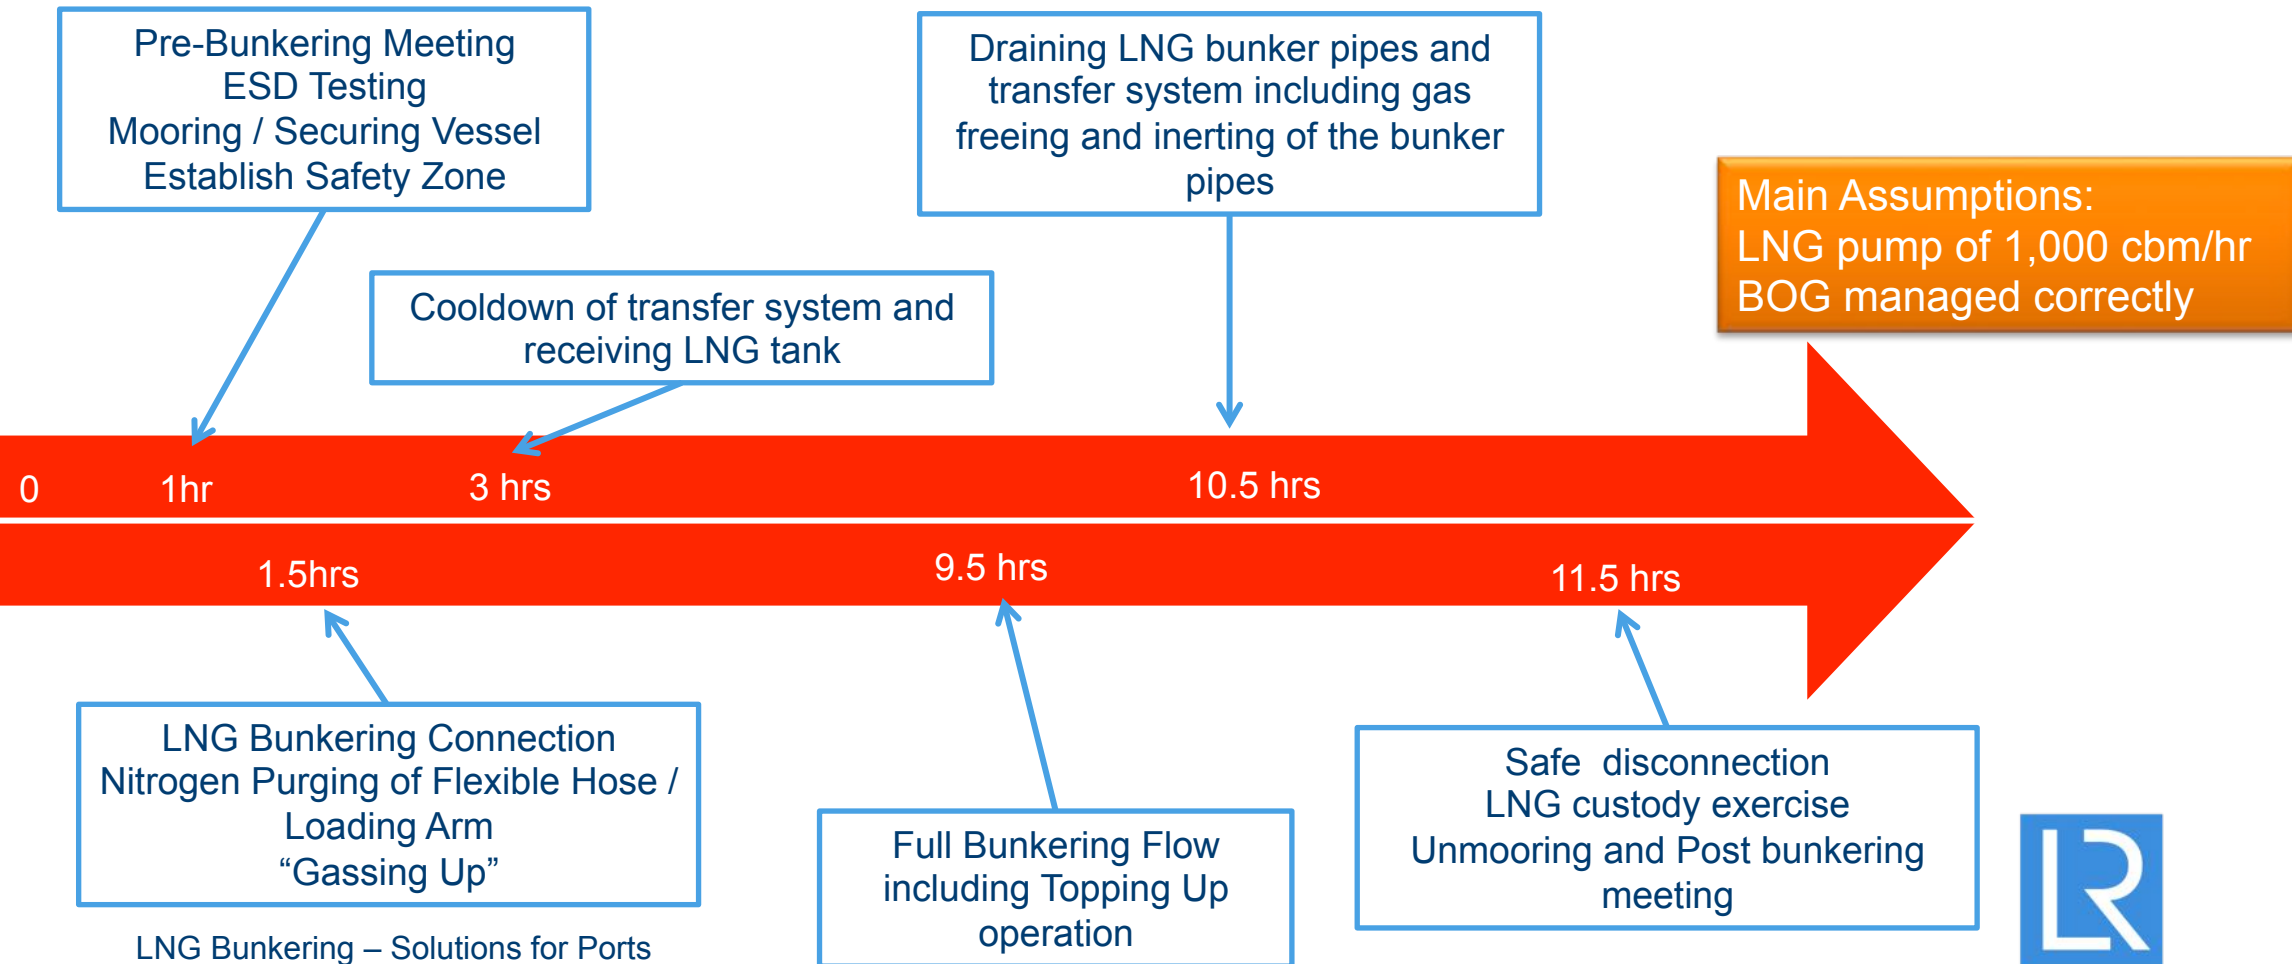

Technology

CASE STUDY: Time to Bunker 6,500 cbm of LNG on Membrane Type Bunker Tanks

Time to transfer 6,500 cbm LNG: **6.5 hrs** Time to complete LNG bunkering safely: **11.5 hrs**

CASE STUDY: Time to Bunker 6,500 cbm of LNG on Membrane Type Tanks on a 18,000 TEU ULCS

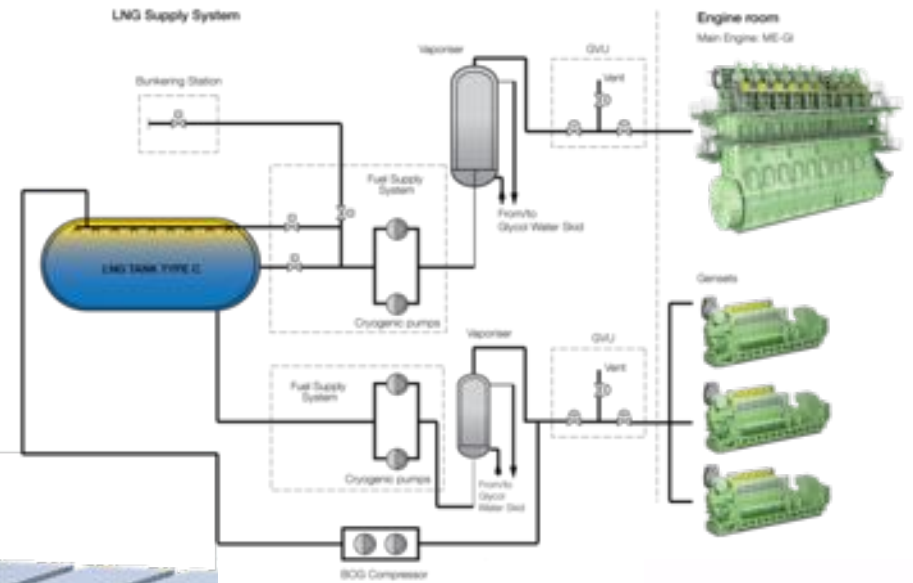

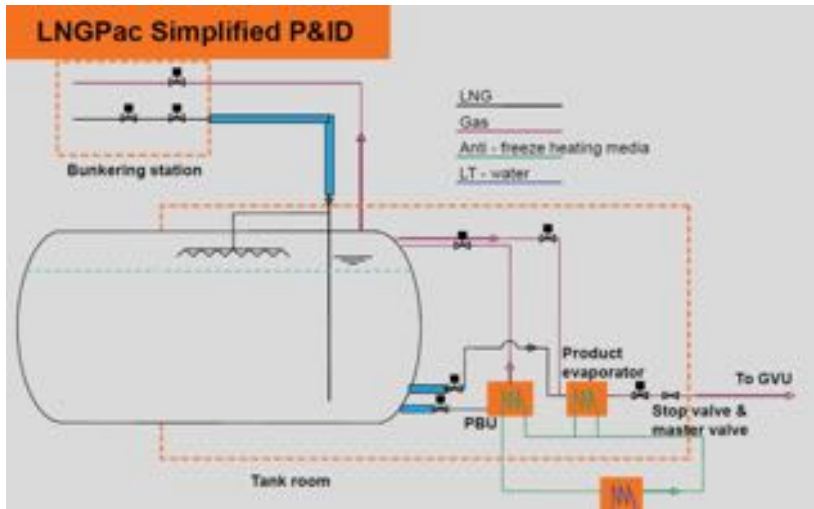

Time to transfer 6,500
cbm LNG: 6.5 hrs

Time to complete LNG
bunkering safely: 11.5 hrs

Technologies and Integration allow reliable LNG bunkering - Gas Fuelled Container Ships

LNG Storage & Processing Basics

- Cryogenic tank holds LNG at abt -160°C
 - IMO Type C (pressure vessel, usually 3-10 barg)
 - IMO Type A/B (eg: prismatic, atmospheric pressure)
 - Membrane (MkIII / GTT96)
- Cold box or fuel preparation space contains piping, instruments, gas vaporizers, to bring gas-phase NG to engine at required P and T
- Bunker station provides connection for reloading the tank
- Dual fuel (oil/gas) or gas-only main engines or diesel generators
- Boilers can also be fitted with gas burners

Main ship design highlights for LNG

- LNG fuel tank shall be installed: volume is abt 1.5x to 2x equivalent fuel oil tank volume
- DF engines are almost identical in size & power to equivalent fuel oil engines
- Gas equipment in machinery space: limited footprint and no additional major hazards (provided that double-wall piping is installed)
- Dedicated tank hold space or gas tanks installed in open areas
- Extra ventilation ducts, vent mast, control system, bunker station
- Gas pipes: double pipe, relatively small diameter

LNG & Low flash point fuels regulations evolution

3.4 Risk Rating

Risks identified during the HAZID were rated in accordance with a risk matrix provided by LR Consulting as shown in the figure below. This matrix is based on LR Consulting's experience in using and developing matrices on behalf of operators in the oil and gas industries. An assessment of risk before and after considering active safeguards was undertaken.

Figure 3: Risk Matrix

It should be noted that the risk rating is only based on the assessment of risk to personnel and that low severity consequences that could result in minor injury have been excluded from the assessment. This approach helps to ensure that the study team only concentrate on significant risks, which is considered to be an appropriate approach for a HAZID of this type.

Working together for a safer world

Rules and Regulations for the Classification of Natural Gas Fuelled Ships

January 2016

LR Approach

- “GF” Machinery notation: obtained by compliance with LR GF Rules
- Goal based design concept
- Some prescriptive requirements but due to the novelty and complexity of the application, Risk Based Design required
- Risk Based Design, or “RBD” required, 4 phases:
 1. **Design screening**: benchmark against LR rules & IGF Code
 2. **HAZID** Risk assessment
 3. Revisions and **bunkering safety study**
 4. **HAZOP** Final design assessment

Another Option: “GR” Gas ready notation. Design and in case partial installation is approved in advance for future completion of the installation and gas propulsion

Design Screening – RBD-1 – LNG as Fuel
CALEDONIAN MACBRAYNE FERRY
10th January 2016 4000

RBD-1 Form No-10 GR(A) / RBD Stage 1

A. Fuel Tank – Protective Distance	Answer
1. At the summer load line, is the fuel tank(s) located at a distance greater than 85 or 11.5 m (whichever is less) from the side of the ship? If the answer is NO or NA (not applicable), please provide further details here. IGF 2.3.8 / IGF 2.3.3 The distance is measured from the point after the point to the primary barrier of the fuel tank (i.e. the barrier necessary to contain spillage). For measurement purposes only, the primary barrier of the tank includes connected components that cannot be isolated, and the loading crane along with its support (i.e. tank structure support system). However, if the distance measured to the adjacent structure is less than that measured to the fuel tank then this distance is used as answer to this question. The value 85 is the general minimum breadth of the side of or below the summer load line strength.	YES: NO-NA 85 or 11.5 m Minimum = 11.5 m
2. Other than at the summer load line, from the side of the ship, is the fuel tank(s) located at a distance greater than 8/10 for a passenger ship or at a distance greater than 0.8 m ³ for a cargo ship? If the answer is NO or NA (not applicable), please provide further details here. IGF 2.3.8 / IGF 2.3.3 For a cargo ship, if the volume of a fuel tank (in m ³) is greater than 1,000 m ³ then the following minimum shall require 0.8 m or the relevant equivalent: - 0.25 = 10 + 0.24 (V ^{0.25}) where 1,000 m ³ < V < 10,000 m ³ - 0.8 = 10 + 0.24 (V ^{0.25}) where 10,000 m ³ < V < 10,000 m ³ and - 2 m, where V > 10,000 m ³ . (As determined by IACS, if the gross design volume of an individual fuel tank at 20°C, including ullage and piping, is less than 1,000 m ³ then the distance is 0.8 m. For guidance on measuring the distance see Guidance 1.)	YES: NO-NA 8/10 or 0.8 m

LR Classed vessels overview

LR has been working on several LNG fuelled ferries/ro-pax projects, most notably:

Ship/Project	Number	Type	Yard	Delivery
Viking Grace	1	RoRo-Pax	STX Turku	2013
F.A. Gauthier	1	RoRo-Pax	Fincantieri	2015
STQ 723,724	2	RoRo-Pax	Davie	2016
BC Ferries 615	3	RoRo-Pax	Remontowa	2016-17
NACKS 212,213	2	Vehicle carrier	NACKS	2016
Argonon	1	IWW Tanker	Trico	2011
Greenland	1(+2)	Cement carrier	Ferus Smit	2015
Arctech NB510	1	Icebreaker	Arctech Helsinki	2016

and more are coming...

Viking Grace

- Delivered in 2013
- Loa 218m
- Service speed 22 kts
- Capacity: 2000+ meters for vehicles, 2800 passengers
- 4x7600 kw dual fuel (MGO/LNG) diesel generators
- 2x10500 kw electric main engines
- 2x200m³ LNG tanks with built-on cold box, Stainless steel, IMO Type C, double wall, vacuum perlite insulated.
- Routes: Baltic sea: Finland, Sweden, Estonia

Fincantieri 6239 / F.A. Gauthier

- Delivered in 2015
- Loa 133.3m
- Service speed 20 kts
- Capacity: 180 vehicles, 800 passengers
- 4x5400 kw dual fuel (MGO/LNG) diesel generators
- 2x7000 kw electric main engines
- 2x280m³ LNG tanks with built-on cold box, 9% Ni steel, IMO Type C, double wall, MLI insulated.
- Route: Matane-Godbout-Comeau, St Lawrence river, Canada

STQ 2nd and 3rd Vessels

- Davie Yard 723, 724 (sister vessels)
- Delivery scheduled in 2016
- Loa 92m
- Capacity: 115 vehicles, 432 passengers
- Dual fuel (MGO/LNG) engines
- 110m³ LNG tank built-on cold box, 304L steel, IMO Type C, double wall, MLI insulated.
- Cross St Lawrence river, Canada

Remontowa / BC Ferries projects

- Remontowa Yard 615/1,2,3 (sister vessels)
- Delivery scheduled in 2016-17
- Loa 107.2m
- Cruise speed 15.5 kts
- Capacity: 150 vehicles, 584 passengers
- 3x1350kw Dual fuel (MGO/LNG) diesel generators
- 2x1400kw azimuth thrusters
- 130m³ LNG tank built-on side cold box, 304L steel, IMO Type C, double wall, vacuum perlite insulated.
- Routes: Vancouver area, Canada

Conclusions

- LNG is a viable fuel for shipping
- Has established as an alternative to scrubbers/SCR to sail in ECA areas
- Thanks to their operating profile and routes, ferries & RoRo vessels are ideal ships to take advantage of LNG as fuel
- LR has established experience and know-how on such vessels
- Regulatory framework is in place to manage the risks arising from gas based propulsion
